Pseudotsuga menziesii var. glauca

Height	35-40 (65) m, fast growing
Width	10-15m
Crown	narrow pyramidal, half-open crown
Bark and branches	brown, grey, grey-black
Leaf	blue-green, evergreen
Flowers	yellow-red, flowers in April
Fruits	hanging cones, long ovoid, reddish brown, 8 - 10 cm
Spines/thorns	None
Toxicity	usually not toxic to people, (large) pets and livestock
Soil type	all
Soil moisture	suitable for dry soil
Paving	tolerates no paving
Winter hardiness zone	5a (-28,8 to -26,1 °C)
Wind resistance	good
Other resistances	resistant to frost (WH 1 - 6), can withstand wind
Application	industrial areas
Shape	clearstem conifer, specimen conifer

This natural variety is more common in the interior of North America than the species Pseudotsuga menziesii. Pseudotsuga menziesii var. glauca occurs in the central part of the Rocky Mountains, from Alberta and British Columbia, Canada to New Mexico, USA in the south. The variety glauca remains slightly smaller, has a slightly narrower crown and has slightly shorter and thicker needles, up to about 3 cm long. The cones are also slightly smaller. Most striking feature is that the needles are significantly bluer in colour than the dark green needles of Pseudotsuga menziesii. Several named cultivars with blue-green and blue needles evolved from the variety glauca. The narrower crown shape combined with the characteristics of Pseudotsuga menziesii, both in terms of soil requirements and applicability, make this tree versatile in use. Grows on all types of soil. Very suitable for use as a solitary tree or in small groups in parks and (large) gardens. Hardiness zone: 5a
