

*Robinia pseudoacacia* 'Nyirsegi' is a Hungarian-origin selection that grows quickly and has a straight trunk with strongly ascending branches. Specially selected for its strong fibre, therefore used for hand tools. Height 20 - 25 m. Because of its vigorous growth, it is often used as a rootstock for 'Umbraculifera'. Characteristic are the large thorns on the branches. The compound leaves are dark blue-green. Short clusters of creamy-white flowers appear in June but the flowering time is shorter than for the species. Produces few legumes. Less wind sensitive than other cultivars. Hardiness zone: 5a
